AquaSentry

What it is

AquaSentry is a water-safety monitoring system for homes and small communities. It uses a sensor station or minibot to check water quality, identify unusual contaminant levels, and present clear next steps when a reading may be unsafe.

What the dashboard shows

- The latest detected contaminant and its measured value.
- The relevant safe limit and confidence in the reading.
- A possible source of the issue and nearby-station confirmation.
- Immediate household safety guidance.
- Treatment options and a report summary for local authorities.

Bot explanation text

Replace the bracketed text below with the final wording you want the bot to use. Keep it short, factual, and easy for a non-technical person to understand.

> **[PASTE YOUR FINAL BOT EXPLANATION HERE]**
>
> Suggested structure: what AquaSentry monitors, who it protects, how it communicates an unsafe reading, and what action the user should take.

Important product note

The current dashboard contains sample arsenic data for demonstration. Connect `renderReading()` in `script.js` to the real sensor or backend before using the page for live decisions. Confirm health guidance and safe limits with the relevant local water authority.
